

Disclaimer

The following report(s) provides findings from an FDA-initiated query using Sentinel. While Sentinel queries may be undertaken to assess potential medical product safety risks, they may also be initiated for various other reasons. Some examples include determining a rate or count of an identified health outcome of interest, examining medical product use, exploring the feasibility of future, more detailed analyses within Sentinel, and seeking to better understand Sentinel capabilities.

Data obtained through Sentinel are intended to complement other types of evidence such as preclinical studies, clinical trials, postmarket studies, and adverse event reports, all of which are used by FDA to inform regulatory decisions regarding medical product safety. The information contained in this report is provided as part of FDA's commitment to place knowledge acquired from Sentinel in the public domain as soon as possible. Any public health actions taken by FDA regarding products involved in Sentinel queries will continue to be communicated through existing channels.

FDA wants to emphasize that the fact that FDA has initiated a query involving a medical product and is reporting findings related to that query does not mean that FDA is suggesting health care practitioners should change their prescribing practices for the medical product or that patients taking the medical product should stop using it. Patients who have questions about the use of an identified medical product should contact their health care practitioners.

The following report contains a description of the request, request specifications, and results from the modular program run(s).

Overview for Request: cder_mpl1p_wp103_v01

Request ID: cder_mpl1p_wp103_v01

Request Description: In this report, we assessed utilization of three monoclonal antibody (mAB) drugs within the Sentinel Distributed Database (SDD): lecanemab, aducanumab, and donanemab. We also quantified how often the mABs of interest were used concomitantly with other drugs and drug classes.

Sentinel Routine Querying Module: Cohort Identification and Descriptive Analysis (CIDA) module, version 14.0.1, with custom programming

Data Source: We distributed this request to 6 Sentinel Data Partners on January 27, 2025. These 6 Data Partners are a subset of the SDD. Data from Medicare patients having both fee-for-service medical coverage and Part D drug coverage are included. The study period included data from June 7, 2021 through May 31, 2024. Please see Appendix A for a list of dates of available data for each Data Partner.

Study Design: To assess utilization, we identified episodes of mAB use in different ways. For each mAB, we identified the number of dispensings and administrations separately, as well as dispensing and administrations combined. We also identified the first episode of new use for a given patient, defined as no evidence of the mAB of interest in the 90 days prior to the first index (dispensing or administration) date. To assess concomitant use, we identified episodes of mAB dispensings and administrations with at least 90 days of enrollment prior to the index date that overlapped for at least one day with episodes of use of the following drugs and drug classes: antithrombotics, anticoagulants, antiplatelets, thrombolytic agents, aspirin >81mg, aspirin ≤ 81mg, antidepressants, selective serotonin reuptake inhibitors (SSRIs), selective norepinephrine reuptake inhibitors (SNRIs), and serotonin modulators. As with the mABs, we required 90 days of enrollment prior to the index date for the concomitant use drugs or drug classes. When assessing concomitant use, we constructed treatment episodes for both the mAB and the concomitant use drugs or drug classes based on days supplied after stockpiling any overlapping days supplied and bridging episode gaps in treatment that were less than or equal to the specified allowance, as appropriate to the exposure type (dispensing or administration). Please see Appendices K, L, M, and N for the study design specifications.

Exposures of Interest: The mABs of interest were lecanemab, aducanumab, and donanemab. The concomitant use drugs of interest were antithrombotics, anticoagulants, antiplatelets, thrombolytic agents, aspirin >81mg, aspirin ≤ 81mg, antidepressants, SSRIs, SNRIs, and serotonin modulators. Please see Appendices B, C, and D for the generic names and codes used to define the mABs of interest in this request. Please see Appendices E, F, and G for the generic names and codes used to define the concomitant use drugs in this request.

Cohort Eligibility Criteria: Eligible treatment episodes came from patients aged 30 years or older with a recorded male or female sex. Additional requirements varied depending on the analysis. When assessing utilization, we did not require any enrollment prior to the index date. When assessing new use, we required 90 days of enrollment prior to the index date, during which enrollment gaps of up to 45 days were allowed; we additionally required no prior use of the index mAB within the 90 days period. When assessing concomitant use, we required 90 days of prior enrollment, but did not exclude episodes with evidence of prior use.

Follow-up Time: For analyses assessing concomitant use, follow-up was based on days supplied after stockpiling and bridging allowable gaps in treatment. The allowable treatment gap (episode gap) varied between exposures and exposure type (dispensing or administration). The allowable episode gap for lecanemab was 21 days if the most recent day supplied was a dispensing, or 34 days if the most recent day supplied was an administration. The respective episode gaps for aducanumab were 96 and 123 days, and for donanemab 33 and 60 days. If the most recent day supplied came from both a dispensing and an administration, the episode gap corresponding to the administration was applied. The allowable episode gap for the concomitant use drugs as either a dispensing or administration was 4 days, with the following exceptions: thrombolytic agents (0 day gap), antidepressants (6 day gap), and SSRIs (9 day gap).

Follow-up time continued until treatment cessation, disenrollment, death, or the end of the study period. We did not construct follow-up time for analyses assessing utilization or new use.

Overview for Request: cder_mpl1p_wp103_v01

Baseline Characteristics: For all analyses, we assessed age, sex, race, and calendar year as of the index date. For analyses of new use and concomitant use, we additionally assessed use of the following medications over the 90 days prior to the index date: lecanemab, aducanumab, donanemab, antithrombotics, anticoagulants, antiplatelets, thrombolytic agents, aspirin > 81mg, aspirin ≤ 81mg, antidepressants, SSRIs, SNRIs, and serotonin modulators. Please see Appendices H, I, and J for a list of generic names and codes used to define baseline characteristics in this request.

Limitations: Algorithms used to define exposures are imperfect; thus, it is possible that there may be misclassification. Therefore, data should be interpreted with this limitation in mind.

Glossary of Terms for Analyses Using Cohort Identification and Descriptive Analysis (CIDA) Module*

Amount Supplied - number of units (pills, tablets, vials) dispensed. Net amount per NDC per dispensing.

Administrations - within this query, administration refers to the Healthcare Common Procedure Coding System (HCPCS) codes used to define medications of interest.

Blackout Period - number of days at the beginning of a treatment episode that events are to be ignored. If an event occurs during the blackout period, the episode is excluded.

Care Setting - type of medical encounter or facility where the exposure, event, or condition code was recorded. Possible care settings include: Inpatient Hospital Stay (IP), Non-Acute Institutional Stay (IS), Emergency Department (ED), Ambulatory Visit (AV), and Other Ambulatory Visit (OA). For laboratory results, possible care settings include: Emergency Department (E), Home (H), Inpatient (I), Outpatient (O), or Unknown or Missing (U). The Care Setting, along with the Principal Diagnosis Indicator (PDX), forms the Care Setting/PDX parameter.

Ambulatory Visit (AV) - includes visits at outpatient clinics, same-day surgeries, urgent care visits, and other same-day ambulatory hospital encounters, but excludes emergency department encounters.

Emergency Department (ED) - includes ED encounters that become inpatient stays (in which case inpatient stays would be a separate encounter). Excludes urgent care visits.

Inpatient Hospital Stay (IP) - includes all inpatient stays, same-day hospital discharges, hospital transfers, and acute hospital care where the discharge is after the admission date.

Non-Acute Institutional Stay (IS) - includes hospice, skilled nursing facility (SNF), rehab center, nursing home, residential, overnight non-hospital dialysis and other non-hospital stays.

Other Ambulatory Visit (OA) - includes other non overnight AV encounters such as hospice visits, home health visits, skilled nursing facility visits, other non-hospital visits, as well as telemedicine, telephone and email consultations.

Charlson/Elixhauser Combined Comorbidity Score - calculated based on comorbidities observed during a requester-defined window around the exposure episode start date (e.g., in the 183 days prior to index).

Code Days - the minimum number of times the diagnosis must be found during the evaluation period in order to fulfill the algorithm to identify the corresponding patient characteristic.

Cohort Definition (drug/exposure) - indicates how the cohort will be defined: 01: Cohort includes only the first valid treatment episode during the query period; 02: Cohort includes all valid treatment episodes during the query period; 03: Cohort includes all valid treatment episodes during the query period until an event occurs.

Computed Start Marketing Date - represents the first observed dispensing date among all valid users within a GROUP (scenario) within each Data Partner site.

Days Supplied - number of days supplied for all dispensings in qualifying treatment episodes.

Dispensings - within this query, dispensings refer to the National Drug Codes (NDCs) used to describe medications of interest.

Eligible Members - number of members eligible for an incident treatment episode (defined by the drug/exposure and event washout periods) with drug and medical coverage during the query period.

Enrollment Gap - number of days allowed between two consecutive enrollment periods without breaking a "continuously enrolled" sequence.

Episodes - treatment episodes; length of episode is determined by days supplied in one dispensing or consecutive dispensings bridged by the episode gap.

Episode Gap - number of days allowed between two (or more) consecutive exposures (dispensings/procedures) to be considered the same treatment episode.

Event Deduplication - specifies how events are counted by the Modular Program (MP) algorithm: 0: Counts all occurrences of a health outcome of interest (HOI) during an exposure episode; 1: de-duplicates occurrences of the same HOI code and code type on the same day; 2: de-duplicates occurrences of the same HOI group on the same day (e.g., de-duplicates at the group level).

**Glossary of Terms for Analyses Using
Cohort Identification and Descriptive Analysis (CIDA) Module***

Exposure - within this query, any [*medication of interest*] exposure refers to both administrations and dispensings of that medication of interest.

Exposure Episode Length - number of days after exposure initiation that is considered "exposed time."

Exposure Extension Period - number of days post treatment period in which the outcomes/events are counted for a treatment episode. Extensions are added after any episode gaps have been bridged.

Lookback Period - number of days wherein a member is required to have evidence of pre-existing condition (diagnosis/procedure/drug dispensing).

Maximum Episode Duration - truncates exposure episodes after a requester-specified number of exposed days. Applied after any gaps are bridged and extension days added to the length of the exposure episode.

Member-Years - sum of all days of enrollment with medical and drug coverage in the query period preceded by an exposure washout period all divided by 365.25.

Minimum Days Supplied - specifies a minimum number of days in length of the days supplied for the episode to be considered.

Minimum Episode Duration - specifies a minimum number of days in length of the episode for it to be considered. Applied after any gaps are bridged and extension days added to the length of the exposure episode.

Monitoring Period - used to define time periods of interest for both sequential analysis and simple cohort characterization requests.

Principal Diagnosis (PDX) - diagnosis or condition established to be chiefly responsible for admission of the patient to the hospital. 'P' = principal diagnosis, 'S' = secondary diagnosis, 'X' = unspecified diagnosis, '.' = blank. Along with the Care Setting values, forms the CareSetting/PDX parameter.

Query Period - period in which the modular program looks for exposures and outcomes of interest.

Switch Evaluation Step Value - value used to differentiate evaluation step. Each switch pattern can support up to 2 evaluation steps (0 = switch pattern evaluation start; 1 = first evaluation; 2 = second evaluation).

Switch Gap Inclusion Indicator - indicator for whether gaps in treatment episodes that are included in a switch episode will be counted as part of the switch episode duration.

Switch Pattern Cohort Inclusion Date - indicates which date to use for inclusion into the switch pattern cohort of interest as well as optionally as the index date of the treatment episode initiating the switch pattern. Valid options are the product approval date, product marketing date, other requester defined date, or computed start marketing date.

Switch Pattern Cohort Inclusion Strategy - indicates how the switch pattern cohort inclusion date will be used: 01: used only as a switch cohort entry date. First treatment episode dispensing date is used as index for computing time to first switch; 02: used as switch cohort entry date and as initial switch step index date for computing time to first switch.

Treatment Episode Truncation Indicator - indicates whether the exposure episode will be truncated at the occurrence of a requester-specified code.

Washout Period (drug/exposure) - number of days a user is required to have no evidence of prior exposure (drug dispensing/procedure) and continuous drug and medical coverage prior to an incident treatment episode.

Washout Period (event/outcome) - number of days a user is required to have no evidence of a prior event (procedure/diagnosis) and continuous drug and medical coverage prior to an incident treatment episode.

Years at Risk - number of days supplied plus any episode gaps and exposure extension periods all divided by 365.25.
